

GIS and Earth Observations for national wetland inventories

Ramsar NWI training webinars | 19-22 October 2020

Marc Paganini

Michael Riffler

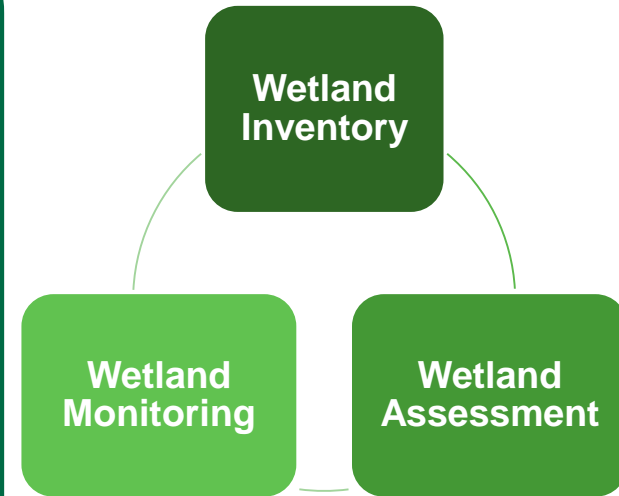

Christian Tottrup

Wetland monitoring from Space

- **Continuous data acquisition:** Earth Observation satellites allow continuous observation of the Earth surface and its changes on a regular basis.
- **Historical archive:** The existing archives of Earth Observation data allow an historical view of environmental issues (40+ years).
- **Multi-scale capabilities:** The different Earth Observation satellites allow the observation of the Earth at global, regional, national and local scales.
- **Multi-sensor information:** The synergic use of optical and radar systems allows different types of environmental parameters and processes to be observed and monitored.

Stringent EO requirements for monitoring wetlands globally

- ***Global and systematic observation scenarios with multi-sensor (radar/optical) approaches***
to improve wetland inventories globally, which are still largely lacking.
- ***Multi-temporal and multi-spectral optical bands with high radiometric performances***
to better distinguish wetland habitats, better delineate wetland areas, and better assess threats from agriculture, urbanisation and climate change.
- ***High spatial resolution***
to have more spatial details for capturing the variety of small habitats in wetlands and for detecting small water bodies.
- ***Short revisiting times***
to capture the seasonality of dynamic wetland ecosystems such as inundation regimes (permanent and seasonal waters) that are important indicators of healthy conditions of wetlands.

Commonly stated obstacles to the scaling-up and operational use of EO in wetland Inventory, Monitoring & Assessment

Restrictive data access policies (including cost)

Not enough “fit for purpose” products

Frequency of observations insufficient to track changes at appropriate scales

Needs for continuity of observations and long-term EO satellite missions

Lack of standardisation of EO data processing methodologies

Lack of analysis ready data

Lack of clear and solid user-oriented methods and guidelines

Capacity building and training

Difficulties to discover and access EO data

Insufficient solid track records of successful case studies

The use of Earth Observation for wetland inventory, assessment and monitoring

An information source for the Ramsar Convention on Wetlands

Provide practitioners with an overview and illustration, through case studies, on the use of EO for implementation of the Ramsar Convention and the wise use of wetlands.

Objective of the report is to:

- Review and report on the **role and use of EO** for inventorying, mapping, and assessment of wetlands, including Ramsar Sites.
- Highlight **existing projects and EO efforts**.
- Present a series of **case studies** which highlight current practices: with an emphasis on practical applications.

https://www.ramsar.org/sites/default/files/documents/library/rtr10_earth_observation_e.pdf

The use of Earth Observation for wetland inventory, assessment and monitoring

An information source for the Ramsar Convention on Wetlands

6 Case Studies on the use of EO for wetland inventory, assessment and monitoring

- Updating information on an existing Ramsar Site: the case of Lake Burullus, Egypt
- EO for regional or national assessments: Mediterranean coastal wetlands.
- EO for monitoring lakes and reservoirs - Lake Victoria and Lake Volta.
- EO for mangrove mapping and change assessment.
- EO for national wetland inventory.
- EO for tropical peatland mapping.

GlobWetland Africa, a free of charge and open-source EO toolbox for wetland inventory and monitoring

Wetland inventory

identification and delineation of wetland areas over large river catchments, in support to national wetland inventorying campaigns;

Wetland habitats maps

for the assessment of the wetland status and for long-term change and trend analysis, inside and around Ramsar/wetland areas;

Water cycle regimes

for the analysis of the intra- and inter-annual variations of the water tables, inside and around Ramsar/wetland areas;

Water quality parameters

such as turbidity, suspended solids and chlorophyll concentration, for the monitoring of the aquatic contamination and physical disturbances of the wetland ecosystem;

River basin hydrology

for the modelling of the water balance and the impact of/on wetlands within river catchments;

Mangroves mapping

for the assessment of the status and trends of tropical mangroves.

GW-A products vs Ramsar strategic objectives and SDG targets

GW-A main products	Contribution to Ramsar Strategic Plan	Ramsar 2016-2024 Targets	SDG Targets
Wetland Inventory	Wetland distribution and status data and information available.	Targets 5, 8, 9, 13	SDG Target 6.6
Wetland Habitat Mapping	Wetland observing system(s) reporting on changes in wetland status .	Targets 1,5,7,11	SDG Target 6.6 SDG Target 15.1
Inundation Regimes	Managing wetlands as natural water infrastructure integral to water resource management at the scale of river basins.	Targets 6,12	SDG Target 6.3 SDG Target 6.6 SDG Target 12.2
Water Quality	By 2020, pollution, including excess nutrients , has been brought to levels that are not detrimental to ecosystem function and biodiversity.	Targets 2,4	SDG Target 6.3 SDG Target 12.4
River Basin Hydrology	Effectiveness of cooperative management in place for shared wetland systems (for example, in shared river basins and coastal zones).	Targets 2, 9, 14, 17	SDG Target 6.5
Mangrove Mapping	National Wetland Policy and instruments fully in place alongside and integrated with ... coastal and marine resource management plans.	Targets 8, 11, 14	SDG Target 6.6 SDG Target 14.2 SDG Target 15.1

A Ramsar framework for wetland inventory and ecological character description

- The Framework provides **guidance on a standard approach** to designing a **wetland inventory program**.
- It includes **information on determining appropriate remote sensing techniques** to apply, wetland classifications and existing standardised inventory methods, and recommends standards for core data fields and data and metadata recording.

Ramsar handbooks for the wise use of wetlands, 4th edition

Appendix II

Determining the most appropriate remotely sensed data for a wetland inventory

1. The following steps provide an outline procedure for assessing which is the most appropriate remote sensing technique for a particular inventory. The

Wetland Inventory of Uganda

Earth Observation support for monitoring and reporting on wetlands, SDG 6.6

Data

Other data used: Landsat 5, 7, 8 and SRTM 30m DEM

Methodology

Optical-based (Sentinel-2, Landsat)

- Combining **multi-spectral** information
- Enhancing spectral signatures making use of **water absorption in NIR/SWIR**
- Unsupervised and **supervised classification** or **thresholding** approaches

Challenges:

- Clouds
- Confusion with shadows
- **Dense vegetation**

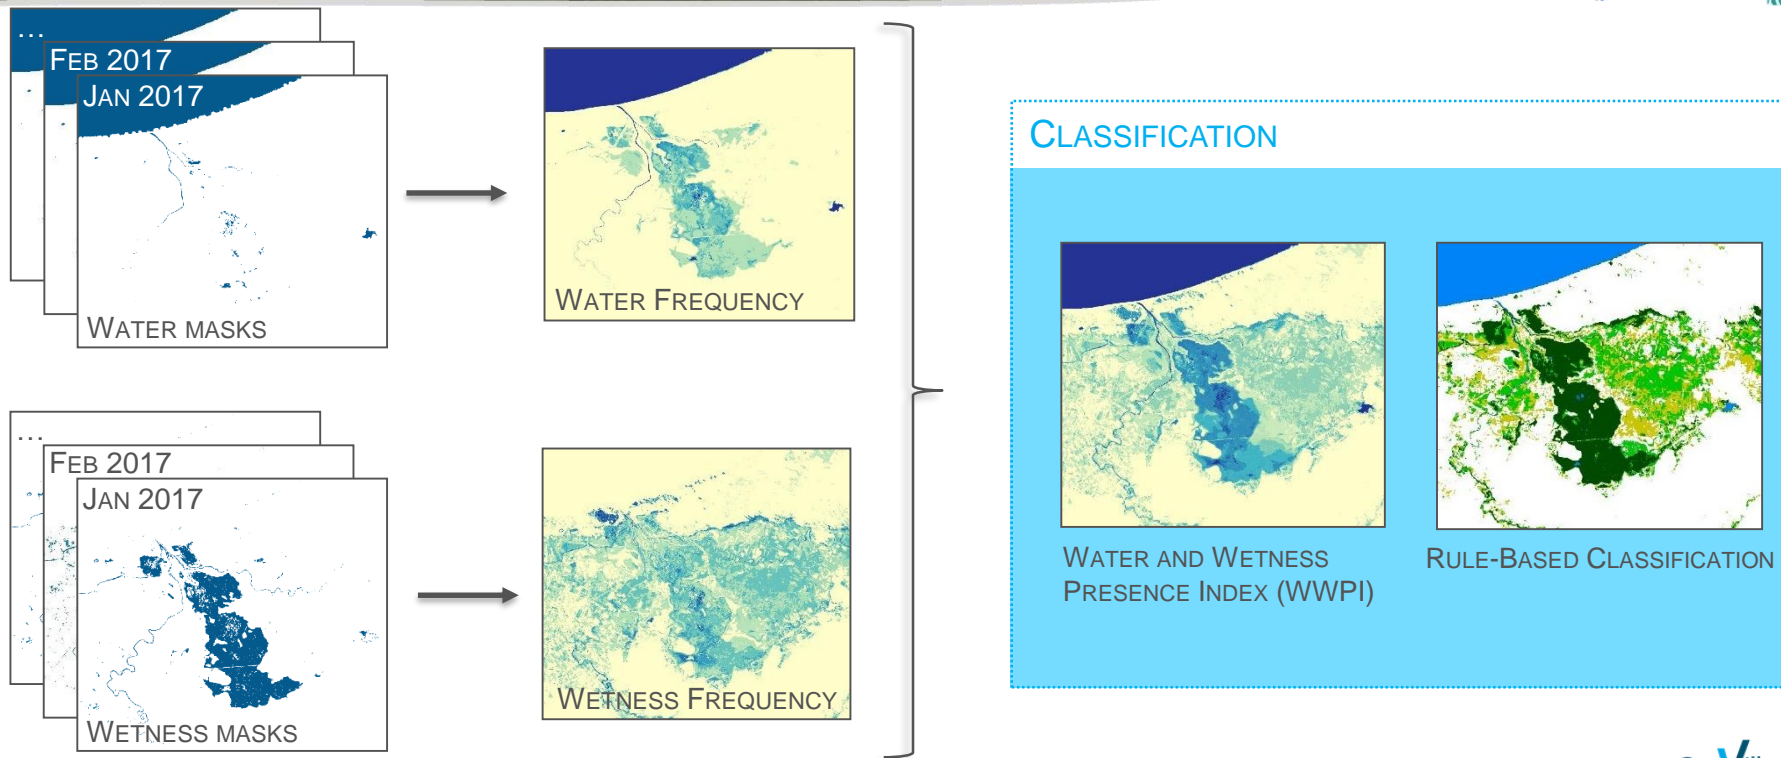

Radar-based (Sentinel-1)

- Different methods depending on type of radar and type of data (imaging radar, interferometric methods)
- SAR sensors **sensitive to dielectric properties** (moisture content) and **geometric attributes** (roughness)

Challenges:

- Sandy/arid regions
- Confusion with other flat surfaces
- **Dense vegetation**

Methodology

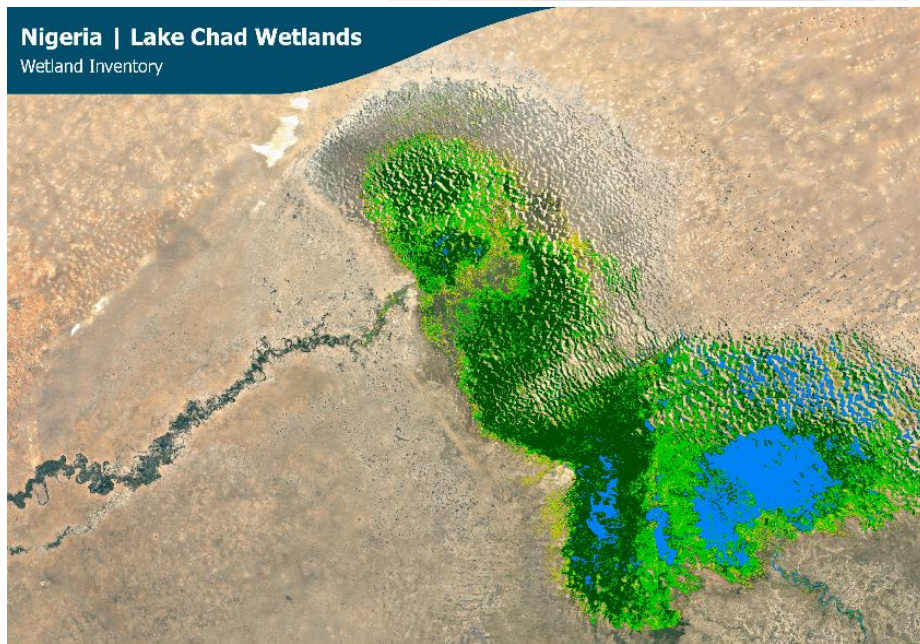

Highly dynamic environments → Time series analysis!

Working on hot-spot regions

National better than EO

EO better than national

EO better than national

National still valid?

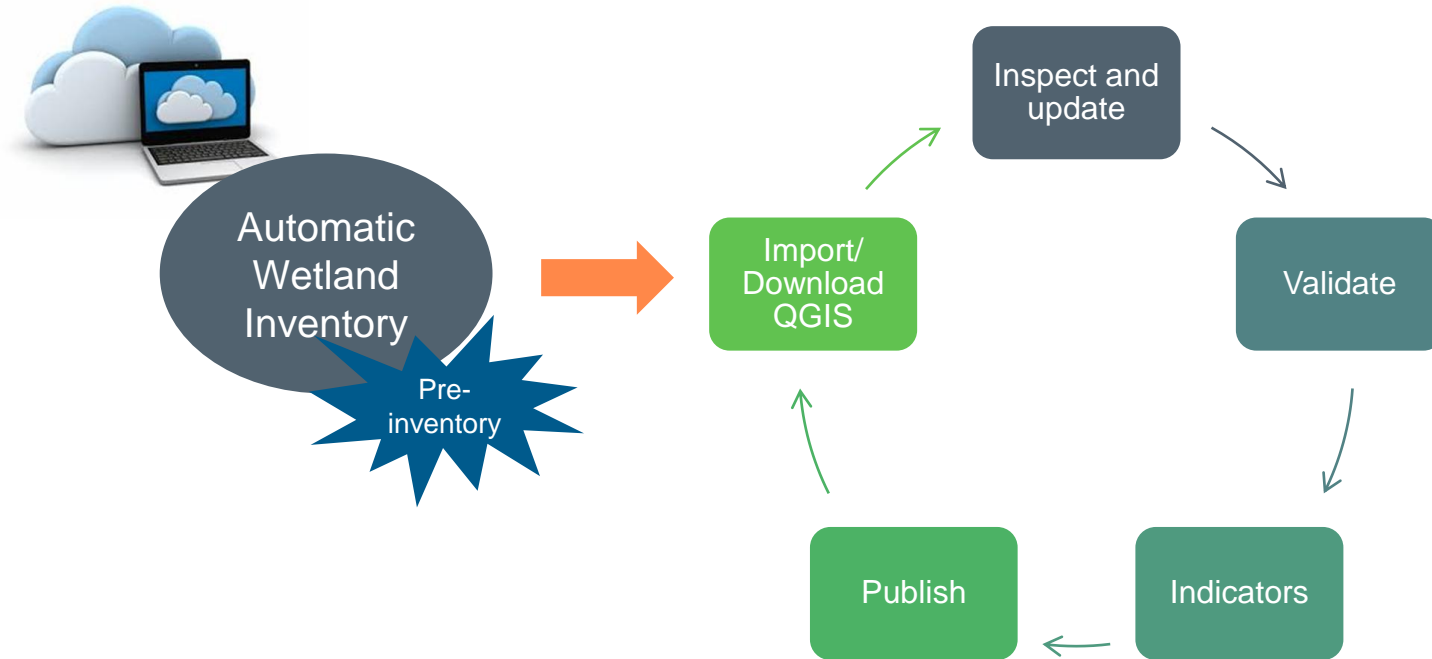

Summary & Outlook - Methodology

- **Optical- and radar-based product** to detect water and wet surfaces
- **Water and Wetness Frequencies** and **Water and Wetness Presence Index** → **Delimitation water-related surfaces/ecosystems**
- Application of **use case specific classification**
- Highly automated production via **Sentinel-1** and **Sentinel-2** data streams processed at Earth Observation Data Centre (EODC) which is part of WEkEO-DIAS **accessible via API-based service**
- **Validated in Europe (externally)** and **Africa (internally)** with good overall accuracies for water and wetness classes

Finalising the NWI

The GlobWetland Africa Toolbox

- **Key capabilities**

- Seamless interface with cloud processing environment for operational large-scale processing and application
- Retrieve, manage and process NWI data as well as integrate in-situ data -> map updating and validation
- Produce wetland information products (incl. wetland habitat mapping) and indicators

The screenshot displays the GlobWetland Africa Toolbox interface. The main window shows a QGIS map with a legend and a workflow panel. A green arrow points from the QGIS interface to the toolbox window.

Legend

Red	Artificial surfaces
Cyan	Intertidal forested wetlands
Purple	Marshes
Brown	Intertidal mud, sand or alt flats
Green	Forest
Light Green	Grassland
Blue	Open water
Yellow	Agricultural areas

Workflow Panel:

 - Wetland time-series analysis

Close

Indicators

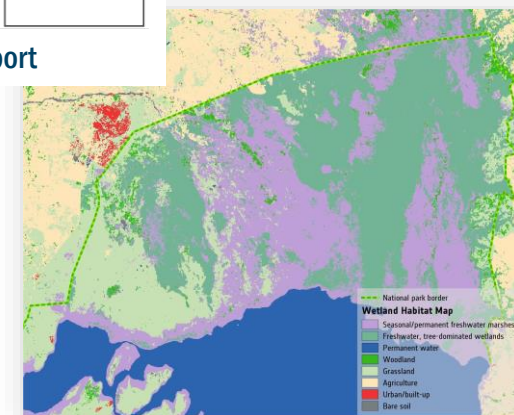

- Apply statistics and perform detailed mapping and analytics to support reporting, planning and decision making:
 - What is the wetland extent and how has it changed over time?
 - $(\gamma - \beta) / \beta \times 100$
 - Is the wetland under threat from urbanization, agricultural encroachment and/or aquaculture development?

2015 | 2016 | 2017
Detection and documentation of changes over time

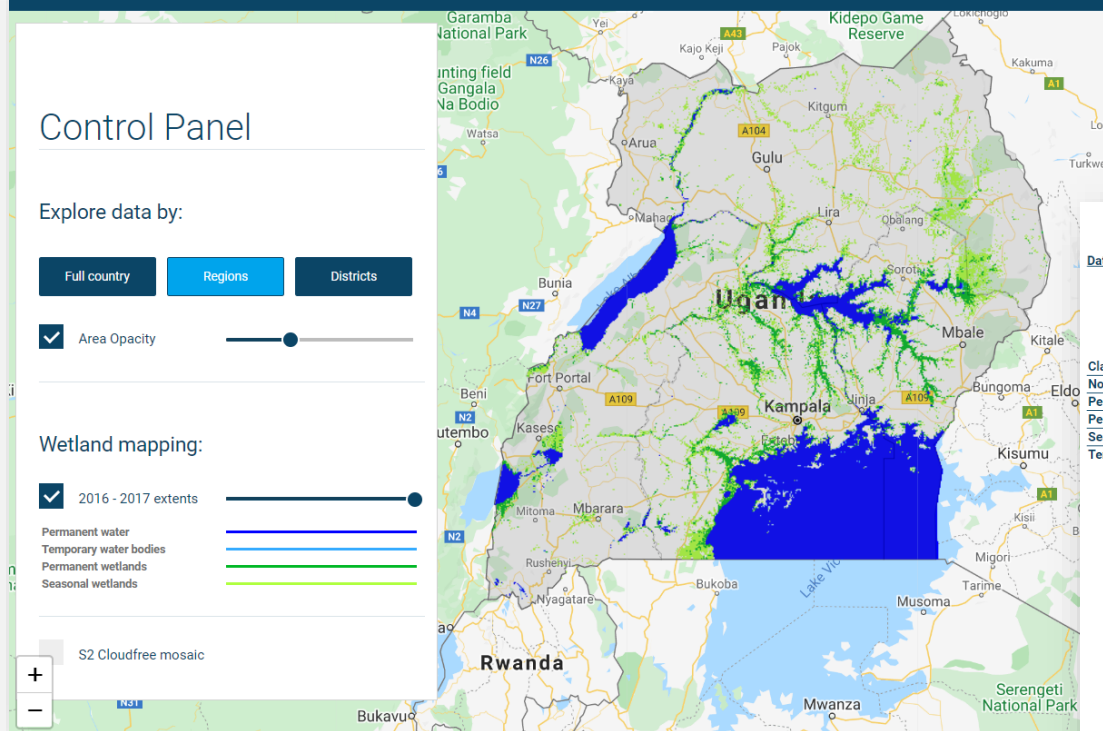

Statistics Analyze Report

Wetland habitat mapping provides a detailed map of individual wetland sites. Example from the Lake George wetlands (Uganda) showing signs of agricultural encroachment into the Ramsar site along the northern boundary.

1.2.1 Transport	0.36%	1,355.37 ha	
1.3 Mineral extraction etc.	0.32%	1,206.82 ha	
Total area:		370,861.28 ha	

- User-friendly satellite data discovery and access
- visualization tools to explore available wetland-related datasets (e.g. GSW)
- Continuous upload of thematic products
- Products download
- On-demand Map / Indicator production (*on-line processing in the future*)
- EO best practices
- Inter-operable with with other GEO portals (OGC compliant)
- Access to s/w toolboxes

Take home message (1/2)

- Previously expressed **limitations in the use of Earth Observation** for deriving wetland information have become less of a constraint.
- The Sentinels of the European Copernicus program (together with freely available data from other space agencies) bring **unprecedented observation capacity** for wetland monitoring.
- The **open and free data policies of government-funded satellite data**, along with **assurance of long-term continuity of observations**, are important incentives for CPs to routinely integrate EO into their work.
- With the increasing availability of “**analysis ready**” **datasets**, the level of expertise required for basic wetland applications has decreased

Take home message (2/2)

- An **increasing number of thematic products** are also being made available (at regional to global levels) which can be used to assess and monitor wetlands directly.
- The development of **new EO platforms for big data exploitation** and the availability of **open source and open access toolboxes** reduces cost for IT, processing and software licensing.
- **Knowledge of the local context** and **collection of in situ data** remains critical for ensuring locally relevant outputs.
- Earth Observation has the potentials to become an important and **integral component of national Wetland Inventories**.
